

NOTHING TOKEN

\$WMNO8 -> \$NOT

This is a summary of the incoming upgrade from the \$WMNO8 token to the \$NOT token.

What is the purpose of the upgrade?

- 1) Retain the historical intrinsic value provided by the first meme token on the Stacks blockchain: \$MNO, by wrapping it into an upgraded version of itself: \$NOT.
- 2) Obtain a fair distribution by excluding the first and second top holders as discussed in the community.
- 3) Upgrade the ticker and name of the token into a simpler and more appealing version.

How is the upgrade happening?

- 1) Taking a snapshot of current \$WMNO8 holders and amounts.
- 2) A contract is set up to handle the unwrapping of \$WMNO8 to \$MNO and rewrapping it into \$NOT, all in one click.
- 3) The wrapping function checks that the address attempting to upgrade is present in the snapshot and that the amount of tokens correspond exactly to the amount in the snapshot.

WARNING: All or nothing - You must wrap exactly the entire amount saved in the snapshot or the transaction will fail. Make sure you don't move or add tokens after the snapshot is taken.

- 4) The wrapping function checks that the tokens are not from the two blacklisted wallets.
- 5) If both conditions (3. and 4.) are checked with success, the function successfully rewraps the submitted \$WMNO8 into \$NOT.

What do the holders have to do?

- 1) Make sure you ABSOLUTELY DON'T move your tokens after the snapshot has been taken. It may be extremely difficult to be able to perform the upgrade if you do.
- 2) Click on the upgrade button on the website that will be provided in the discord and make sure to commit the entire amount of \$WMNO8 tokens in the address committing to the upgrade.
